Many of us know about social networking and are using some form of social networking. It is part of everyday life, such as text messages on mobile phones, chat on Facebook, sending e-mails. All these modern types of technologies not only make people more accessible but also deepen the connection with people and help to keep in touch with friends who have lived far away or have just left home. But at the same time, all these things need to be used with caution. These Internet and mobile resources are likely to bring cruel reality to people.

Network ethics is an ethical, legal and social problem related to network technology. It examines the impact of network technology on social, legal, and ethical systems. We also evaluated social policy and laws developed in response to questions arising from the development and use of network technologies. There is a cooperative relationship here. Network ethics is a more perfect label than computer ethics. Computer ethics may represent research on incomplete ethical issues for computers and computing professionals. It is more perfect than Internet ethics and limited to ethical issues affecting computer networks.

Network ethics is research on moral, legal and social issues related to network technology. It evaluates our social policy and law in response to problems arising from the development and use of network technology. Online world ethics mainly includes the following questions: - Ethical theory assumes that people can choose reasonable and free. We need a moral theory to guide us in analyzing ethical issues. We need these theories to evaluate whether simple alternatives can be used in ethical review. We need these theories to tell everyone not to reward you as usual. In order to prevent such defects of society, we need the following theory as well.

Introduction Networking is what we connect and participate in, or virtual reality. In our context, network relationship refers to the commitment and social connection of the people we have met through online platform such as social media platform. Examples of social media platforms that promote networking relationships are Facebook and Twitter. Internet addiction is "personal introduction". According to Merriam Webster's dictionary, poisoning is a strong but harmful need to maintain something or do something. Regarding Internet connection dependence, "Because of addiction to social networks, chat rooms, text messages, text messages, virtual online friends are more important than actual relationships with family and friends" (Ramdhonee 2014) . Why is this topic interesting?
